Formosa Plastics Group Neihu Building

In response to the urban renewal of the original FPG headquarters site, the Group relocated its corporate headquarters to the Neihu Building in 2023. Under the leadership of Chairman WenYuan Wong, the Group now operates in a brand-new, comfortable, and smartly efficient work environment.

HISTORY

The world's smallest PVC resin plant began to drive Taiwan's economic development in 1954.

PVC resin was transported to Kaohsiung Port via ox-carts for loading and export in 1957

FPG established Formosa Plastics Corporation in 1954. The PVC resin plant, with a daily production capacity of 4 tons, began production in 1957 and was the smallest PVC resin plant in the world at the time. However, due to the low production volume, relatively high cost, and lack of downstream customers in Taiwan, product piled up and sales was sluggish, creating a problem for the company. To overcome this issue, the company carefully considered its situation and decided to increase production to lower unit cost. It also began building a processing plant to utilize the PVC

resin, and then exported the processed goods.

As a result, daily PVC resin production was increased from 4 tons to 20 tons. Nan Ya Plastics Corporation was established in 1958 to process PCV resin into PVC tubes, rubber, and tape. New Eastern Plastics Product Corporation was subsequently established to make use of the goods from Nan Ya Plastics Corporation's second processing, and produced goods from tertiary processing such as purses, suitcases, shoes, curtains, raincoats, and blow toys. With an abundant supply of materials

from Formosa Plastics and Nan Ya Plastics, New Eastern Plastics Product Corporation entered international markets and received a continuous stream of purchase orders. However, the Founder resolutely decided to shut down New Eastern Plastics Product Corporation and encouraged employees to start their own businesses. They thus created an unparalleled tertiary processing system which led to the flourishing petrochemical industry later on and greatly contributed to Taiwan's economic development.

FPG continued to diversify after laying the foundation for plastic raw materials and processing. The group established Formosa Chemicals & Fibre Corporation in 1965, which used branches and small logs to produce rayon, yarn, fabric, and apparel, formally bringing FPG into the textiles industry. Nan Ya Plastics Corporation subsequently established a plant in 1968 to produce polyester stable fiber, and FPG established a plant the same year to produce modacrylic yarn. Formosa Chemicals & Fibre

Corporation established a plant in 1974 to produce nylon fiber and fabric. A large dyeing and finishing plant was established to increase the added value of the products and provide downstream customers with more complete services. FPG is the only company in Taiwan capable of manufacturing four types of fibers and providing dyeing and finishing, and the group is also one of the largest fiber manufacturers in the world.

The first location of FPG – Kaohsiung plant

The first adhesive tape machine of Nan Ya Plastics Corporation

After entering the textile industry, FPG recognized that the thriving electronics and IT industry in Taiwan still relied on imports for main parts and components, and had Nan Ya Plastics Corporation invest in a plant to manufacture printed circuit boards (PCB) and copper clad laminate (CCL) in 1984. The main reason why PCB was selected as the first step for entering the electronics industry was because FPG has always been in the petrochemical, plastics, and textile industries, and was unfamiliar with the electronics and IT industry. PCB is the most fundamental part in the electronics and IT industry. PCB has a long product life cycle, few variations, and the key to success is quality, the production process, and cost control. These are all FPG’s strengths gained through its management experience, therefore giving FPG an increased possibility of success. PCB related business operations allowed us to fully understand and become familiar with operations of the electronics and IT industry, providing a basis for further development.

Today, we have successfully established a vertically integrated production system for electronics raw materials, and further invested in the production of DRAM and wafers, which are key materials for upstream industries, significantly contributing to the self-sufficiency of Taiwan’s electronics and IT industries.

FPG saw the insufficient supply of upstream petrochemical materials in Taiwan in the 1970s, and the dependency on imports that often forced companies to purchase raw materials at higher

Formosa Plastics Group Diversified Industrial

Mailiao Industrial Complex

prices, which reduced their competitiveness. FPG proposed building a naphtha cracker to resolve the problem of insufficient petrochemical raw materials numerous times starting in 1973, but the proposals were all turned down. It was not until 1986 that the government approved the proposal, and FPG began to construct Taiwan’s Sixth naphtha cracker, which is the Sixth Naphtha Cracker Project. Formosa Petrochemical Corporation was established in 1992 in coordination with the operations of the Sixth Naphtha Cracker Project, and it was responsible for constructing the refining plant, naphtha cracker, and co-generation power plant. All of the plants were completed and have begun production, and a series of petrochemical plants were subsequently completed and have also begun production. We are beginning to enjoy the advantages from vertical integration in the Sixth Naphtha Cracker Project, which has further enhanced our overall operating capabilities.

After seven decades of development, FPG is currently comprised of over a hundred companies, including Formosa Plastics Corporation, Nan Ya Plastics Corporation, Formosa Chemicals & Fibre Corporation, Formosa Petrochemical Corporation, Formosa Smart Energy Tech Corporation and Formosa Ha Tinh Steel Corporation, and has plants in Taiwan, the United States, China, Vietnam, the Philippines, and Indonesia. FPG also has a large number of education and healthcare institutions, making it one of the largest private enterprises in Taiwan.

ORGANIZATION AND OPERATION STRUCTURE

Complete corporate organization and management system

Administrstion Building in Malliao Industrial Complex

To pursuit the rationalization of management, the Group Administration, functioning as a professional staff and service unit, was established to coordinate resources and perform the cooperative function in the Group. The Office is responsible for coordinating the resources of the group and unleash the capabilities of FPG. Hence, besides management and improvement tasks, the Group Administration are also responsible for formulating group-wide strategy, computerized planning and implementation, business audits, raw materials procurement, fund allocation,

construction, legal affairs, and public relations. Each company has a President's Office, business department Manager's Office, Factory Office, thereby forming a complete staff hierarchy. Furthermore, we also established accounting departments, management departments, storage and transportation departments, technology departments, and labor safety and health offices as needed. We adopted the following business management system for each unit to serve its function in the organization and improve our overall business performance:

1. Business department system:

To prevent inefficiencies resulting from the growing scale of our Group we thoroughly implemented the business department system to comply with the principles of integrated production and sales and responsible management. Each company in the group is divided into several business departments based on their respective industries. The purpose is for each business department to be able to make comprehensive plans for production, sales, and business goals based on its organization, manufacturing procedures, and product structures. A "profit-centered" system is also implemented with separate units that calculate the profit/loss of each plant or product, and business performance is measured based on cost and revenue of products using accounting management and analysis forms. The responsibilities of each unit are clearly defined to make management more reasonable.

2. Goal management system:

To monitor the business performance of each unit, we pay special attention to performance and cost management. We review and find the causes of abnormalities by analyzing the difference between goals and actual performance, and formulate improvement measures to achieve cost control and better performance. We utilize "unit cost analysis" for an in-depth analysis of the individual costs in products, and then set a target cost on this basis. We also analyze the difference between actual cost and standard cost through abnormality management, and formulate improvement measures based on the results. New goals are set based on the effectiveness of improvements, and the cycle is repeated to improve the benefits and make costs become more reasonable.

3. Individual performance system:

We comprehensively implemented the individual performance reward system to make the compensation of employees more reasonable, align employees' interests with the company's interests, and give employees a sense of involvement by encouraging them to find and solve problems. Employees are rewarded in the form of bonuses according to the regulations for rewards and which are based on their actual performance. The performance is also used as the basis for annual performance evaluations, thereby increasing the quality of their work, improving production efficiency, and increasing the income of employees.

To achieve sustainable development and high-level growth, we have diversified our business and engaged in multilateral development. All management systems, including supplies, productions, operations, construction, personnel finance, performance analysis, and healthcare, are computerized and online to make management more reasonable and to achieve better business performance. We are also making our plants smarter and extensively collecting and analyzing data on production processes to determine optimal process conditions. We also implemented AI technology to produce immediate improvements to production efficiency and product quality. We constantly introduce new concepts and new technologies on the basis of our solid management foundation in coordination with technological developments, and thereby enhance our competitiveness, in the hopes of seizing new opportunities and pursuing sustainable development in this volatile global market.

PRODUCTION IN TAIWAN- MAIN BUSINESS ITEMS

Industrial development that spans multiple fields

Mailiao Industrial Complex- Mailiao Port

Production units of FPG in Taiwan does not only include Formosa Plastics Corporation, Nan Ya Plastics Corporation, Formosa Chemicals & Fibre Corporation, and Formosa Petrochemical Corporation, but also over 50 other companies, including Formosa Smart Energy Tech Corporation, Formosa Heavy Industries, Formosa Sumco Technology Corporation, Nanya Technology Corporation, Nan Ya Printed Circuit Board Corporation, Nan Ya Photonics Inc., and Formosa Biomedical Technology Corporation. The companies are engaged in the businesses of oil refining, petrochemicals, plastic materials, secondary processing of plastics, fiber and textiles, electronic materials, production of mechanical and new energy products, and transportation.

1. Oil refining, petrochemical, and plastic raw materials

Formosa Petrochemical Corporation is currently the only private company in Taiwan that operates a refining plant and naphtha cracker. Gasoline and diesel produced by the refining plant have been sold in gas station franchises around Taiwan since September 2000, creating a foothold in the domestic oil products market. As of December 2024, FPG’s market share is approximately 22.5%.

Naphtha cracker No. 1 and No. 2 were completed and began production in 1999 and 2000 respectively, and naphtha cracker No. 3 was completed and began production in 2007; the total production capacity of ethylene reached 2.935 million tons a year.

FPG’s current annual production capacity of PVC resin has reached 3.23 million tons, making FPG one of the world’s largest manufacturers. Meanwhile, Nan Ya Plastics Corporation, which manufactures plastic tubes, rubber, and tape, has also become the world’s largest secondary PVC plastics processing plant.

Besides ethylene, propylene, PVC resin, and the plastics processing businesses, we also produce liquid caustic soda, VCM, EDC, MBS, POM, HDPE, EVA, LDPE, LLDPE, PP, AN, MMA, MAA, ECH, MTBE, B-1, DEHP, AE, NBA, ABS, PS, PC, PTA, SM, PTMG, and PIA, which are intermediate petrochemical materials, and we rank as first for each product in terms of market share.

Refinery in Mailiao

2024 Taipei Textile Exhibition

2. Fibers, textiles and carpets

We currently manufacture polyester, nylon, carbon, glass, and elastic fibers. We are also a global market leader for most fibers with respect to production volume. Our capabilities also include textiles, dyeing, and finishing equipment for manufacturing gray yarn, gray cloth, dyed yarn, and dyed cloth. Our carpet plant is currently the only professional carpet plant in Taiwan, and over 70% of raw materials are from FPG's system, achieving integrated production from raw materials to finished goods. We also have embroidery machines and spray dyeing equipment to manufacture square carpets with exquisite patterns, broadloom, and artificial grass; our products are marketed and recognized worldwide.

Post-Consumer Recycled Fabric

3. Electronic materials and products

FPG's products in the electronics industry can be divided into printed circuit boards and semiconductors. For printed circuit boards, FPG built a complete vertically integrated supply chain from upstream glass yarns, glass fabrics, epoxies, and copper foil to downstream CCLs and printed circuit boards. Upstream silicon wafer, midstream DRAM and downstream packaging/testing businesses give FPG full-spectrum involvement and a competitive position in the IC sector. In addition, FPG also step into LED lighting to provide systematic solution in all directions.

4. Mechanical products

Our products and services include power plant and co-generation system equipment manufacturing and turnkey services, smart storage and logistics systems, oil refining and petrochemical process equipment, heavy object transportation and lifting, industrial gear reducers, high speed increaser (reducer), large precision gears and rubber lining. We are the largest mechanical equipment manufacturer and turnkey service provider in Taiwan.

Taiwan's Largest Battery Cell Manufacturing Facility –
Formosa Advanced Technologies' Changbin Plant

Formosa Automobile Corp.

5. Transportation Business

Besides three land transportation companies, namely Formosa Fairway Corporation, Formosa Plastics Transport Corporation and Formosa Petrochemical Transportation Corporation, we also established our first chemical shipping fleet in 1981 to lower our raw materials transportation costs and to ensure the delivery schedule. The shipping fleet was expanded to meet the large demand for raw materials, such as: oil products, petrochemical materials, and coal used by the power plant in the Sixth Naphtha Cracker Project. The fleet currently has 42 ships, including 14 chemical/oil tankers, 2 oil product tankers, 2 naphtha tankers, 7 crude oil tankers (ranging from 280,000 to 300,000 tons), 16 bulk carriers (ranging from 37,000 to 205,000 tons) and 1 container ship.

6. New Energy Business

Formosa Smart Energy Tech Corporation was founded in 2022 for the vertical integration of resources within the Formosa Plastics Group. The company was established for the four major fields of "energy-saving, energy storage, new-energies, and recycling." With a domestic lithium iron energy storage system that has comprehensively passed UL/IEC safety certifications, it can be applied to ESS, home energy storage, and electric vehicles, and has successfully entered international markets, including the United States, Europe, and Africa. The company has established cell and module plants and introduced battery recycling technologies for the development of a domestic battery industry chain to achieve a circular economy and environmental sustainability. Additionally, the company has invested in the research and development of "microalgae carbon capture" and accelerated the promotion of various new energy industry developments to help enterprises shift towards carbon neutrality.

CORPORATE TRANSFORMATION STRATEGIES AND PROGRESS

Facing the Challenges of Change and Creating a Sustainable Future Together

In response to the profound transformation of the global industrial structure and to safeguard its future competitiveness, FPG has proactively launched five major transformation initiatives focused on product innovation, business restructuring, low-carbon development, energy transition, and digitalization. These initiatives are being actively and comprehensively implemented across the organization.

In addition to actively developing and expanding markets for high-value-added products, the Group is also advancing forward-looking technologies and product R&D through three key strategies: strengthening R&D personnel, pursuing technology transfer opportunities, and establishing a global market presence.

At the same time, the Group is expanding into emerging sectors such as advanced medical materials, regenerative medicine, and new energy, focusing on the development of differentiated and high-value-added products, thereby accelerating the diversification of its corporate portfolio.

All-solid-state batteries

Advanced medical materials

THE SIXTH NAPHTHA CRACKER PROJECT

Global expansion plan based in Taiwan

Total development area reaching **2,603** hectares
Total investment amounting to USD **29.62** billion

Mailiao Industrial Complex

In light of the severe shortage of basic petrochemical materials in Taiwan over the years, which has limited the development of the petrochemical industry's mid-stream and down-stream industries, Formosa Plastics Group proposed the building of a naphtha cracker to resolve the problem of insufficient raw materials numerous times starting in 1973, but all the proposals were turned down. It was not until 1986 that the government approved the proposal for the Sixth Naphtha Cracker Project.

The first task at hand after the project was approved was site selection. The plant was originally planned to be built in Yilan Lize, in an area with 280 hectares of land, but was relocated to Taoyuan Guanyin in 1988 after irrational protests by environmental activists. FPG later abandoned the plan in Taoyuan Guanyin due to a similar reason. Chiayi Aogu and Yunlin Taixi were also evaluated, but they were found to be incompatible with the project, and a site still could not be decided after several setbacks. It was not until 1991 that Mailiao Township, Yunlin County, was selected, and we began carrying out land reclamation and plant construction.

Mailiao District and Haifeng District, developed by the Sixth Naphtha Cracker Project, are located at the estuary of Zhuoshui River in the northmost end of Yunlin County. The area stretches approximately 8 km from north to south, and extends 4 km offshore from the coastline. Most of the land in the area is below sea level, so it was necessary to carry out large scale land reclamation and ground improvements to secure the foundation of the site. The total reclaimed area is approximately 2,255 hectares and there is a channel separating the site from coastal fish farms.

Mailiao Township is commonly known as the place "where the water ends and the wind begins," and not only is it inconvenient to access, but also extremely poor weather conditions for six months every year due to the strong northeast monsoon affect the area. The Sixth Naphtha Cracker Project was a massive construction project that was built up from nothing.

The Sixth Naphtha Cracker Project includes a refining plant which is capable of refining 25 million tons of crude oil every year, a naphtha cracker with an annual capacity to produce 2.935 million tons of ethylene, and related petrochemical plants, heavy machinery plants, a co-generation power plant, and Mailiao Harbor. Furthermore, seeing the impact of Taiwan's severe power shortage on domestic and business developments, FPG decided to establish a coal-fired power plant that will be connected to Taiwan Power Company's power grid, so as to help resolve Taiwan's power shortage.

At present, the total investment amount of the Sixth Naphtha Cracker Project is approximately USD29.62 billion (including the industrial harbor and power plants). A total of 56 plants were constructed, and all plants have begun production.

After the Sixth Naphtha Cracker Project was completed, Taiwan's ethylene self-sufficiency ratio increased from 38% in 1994 to 100% in 2024, with an output value of USD36.24 billion in 2024 and government tax revenue increased by more than USD488.1 million, and it drove the development of mid-stream and down-stream industries.

The Sixth Naphtha Cracker Project effectively lowered operating costs through its comprehensive planning which included a power plant, industrial harbor, and a series of related facilities. The various petrochemicals are vertically related and transported to nearby locations, saving transportation costs. The supply of raw materials is stable and fully utilizes the benefits of vertical integration. Hence, the products are very competitive internationally. The scale and content of the 56 plants constructed under the Sixth Naphtha Cracker Project are as follows:

Border dike construction

Ground improvement

1. Project construction

▪ Land reclamation :

Approximately 109.15 million cubic meters of sand was used, which is enough to cover the 8-lane highway that stretches 373 km from Keelung to Kaohsiung in sand 3-stories high. The area of reclaimed land is approximately 2,255 hectares, which is about 8% of the area of Taipei City (27,180 hectares) and 0.062% of the area of Taiwan.

▪ Foundation equipment construction :

The total length of piles that were installed reached 4.7 million meters. 9.04 million cubic meters of concrete was used (requires approximately 1.97 million MT of cement).

▪ Plant construction :

A total of 56 plants, including a refining plant, naphtha cracker, co-generation power plant, power plant, heavy machinery plant, boiler plant, fab, and other petrochemical related plants were constructed in a single industrial complex. The length of pipelines in the complex stretches over 3,000 km.

▪ Complex area :

Approximately 2,603 hectares, over four times the total area of Linyuan Industrial Park (403 hectares), Dashe Industrial Park (109 hectares), and Toufen Industrial Park (95 hectares).

2. Mailiao Harbor

The project's Mailiao Harbor covers an area of 476 hectares. The depth of navigation channels at mean sea level reaches 24 meters, which allows access by 300,000-ton vessels. It is not only the deepest port in Taiwan, but also the first industrial port to be constructed with private investments, and also Asia's first EcoPort. The annual cargo throughput of Mailiao Harbor reaches 70 million MT, the second highest in Taiwan, and is only behind Kaohsiung Port. Even though Mailiao Harbor is an industrial port operations of the port have benefited the vast hinterland, providing Yunlin with convenient sea transportation while driving industrial and local developments.

3. Independent Power Plant

Four large coal-fired power generators were planned for the project, each with a capacity of 600,000 kW. Three generators with a total capacity of 1.8 million kW have been completed, and all of the electricity is sold to Taiwan Power Company and fed into its power supply system, greatly helping to resolve Taiwan's insufficient power problem.

Sustainable Aviation Fuel (SAF)

4. Refining plant

The daily refining capacity is 540,000 barrels, which is equal to 25 million MT of crude oil a year. The annual production volume of naphtha can reach 3.75 million MT, which is used by plants in Mailiao Industrial Complex. Meanwhile, gasoline, diesel, and aviation fuels are also produced.

5. Naphtha cracker

A total of three naphtha crackers were constructed to produce ethylene, propylene, and butadiene, of which annual production capacity of ethylene reaches 2.935 million MT, the highest capacity of a single plant in Taiwan. It is an important basic industry that supplies materials for special chemicals, IT, and high-tech domestic industries.

6. Co-generation power plant

Mainly produces electricity, steam, industrial water, ultra-pure water, nitrogen, oxygen, and compressed air for use by relevant plants in Mailiao Industrial Complex. The installed capacity of the self-usage power generation system currently is 2.75 million kW, including 15 qualified co-generators with a total installed capacity of 2.15 million kW, the remaining 0.6 million kW unit is approved by the Energy Administration of the Ministry of Economic Affairs as self-use power generation equipment. The 16 units in total are the largest co-generation power plant in Taiwan. The electricity generated is used by manufacturing processes, and any excess electricity is sold to Taiwan Power Company to help alleviate the pressure on the power grid in Taiwan.

7. Machinery plant and boiler plant

The machinery plant mainly designs, manufactures, installs, and constructs oil refining and petrochemical process equipment (reaction tank, tower, pressure container, heat exchanger). The plant has obtained “S,” “U,” “U2,” and “R” certifications from the ASME. The overall manufacturing ability is 12 M^φ x 120 ML x 2,000 MT, meaning that a single piece of equipment has a diameter exceeding 12 m, length of 120 m, and weight of 2,000 MT. The boiler plant mainly plans, designs, manufactures, installs, and constructs equipment for the cogeneration power plant and power plant. Production capacity: Co-generation power plants can produce up to 35-150 MW and independent power plants can produce 600 MW.

8. Fab

The fab is a joint venture between FPG, Asia-Pacific Investment Co., Ltd., and Japan's Sumco Techxiv Corporation that produces semiconductor-grade wafers. These wafers are important substrate materials for IC, and can also be used in the substrate of solar power batteries.

9. Spandex Plant

The plant is a joint venture between FPG and Asahi Kasei Corp. that produces spandex and PTMG. Its current annual capacity is 5,000 MT of spandex and 21,000 MT of PTMG. Spandex is extensively used in functional clothing and medical products, and has become indispensable to artificial fibers.

10. The Sixth Naphtha Cracker Project Investments

Product Category	Investing Company	Factory	Product	Capacity (10000 MT/Y unless otherwise noted)
Petroleum Products	Formosa Petrochemical Corp.	Refinery plant	Naphtha, gasoline, diesel	2,500(Refinery)
	Simosa Oil Co, Ltd.	Asphalt plant	Asphalt	30
Petrochemicals & Chemical Products	Formosa Plastics Corp.	Acrylic Acid & Ester plant	AA/AE	11.1/15.4
		Polyvinyl Chloride plant	PVC	50.6
		Vinyl Chloride Monomer plant	VCM	80
		Caustic Soda plant	Caustic Soda	133

		Boiler Shop	Equipment for Cogeneration and utility power plants	500T/H X 8ST
Electronics	Formosa Sumco Technology Corp.	Wafer fabrication plant	8-inch silicon wafers 12-inch silicon wafers	

CONSOLIDATING ESG SUSTAINABLE DEVELOPMENT FOR FPG

We actively consolidate various management tasks to move toward sustainable development

Formosa Plastics Group has remained firm to long lasting management philosophies including "diligence, perseverance, frugality and trustworthiness", "strive for excellence", "positive contribution to the society", and "sustainable development", thus, we actively carry out various management tasks to achieve sustainable development. In 2006, FPG established the "Energy Conservation and Emission Reduction Task Force" to ensure environmental protection while pursuing economic development. In 2020, the scale of the task force was expanded with a new title "FPG ESG Promotion Committee". The newly made Committee is to ensure that the entire enterprise is committed to various ESG (environmental, social, governance) tasks.

Achieving carbon neutrality by 2050

The carbon emissions of FPG reached its peak in 2007 with 61.48 million tons, therefore, 2007 was made FPG’s base year for carbon reduction. The short-term goal is to lower emissions to 49.18 million tons by 2025, a 20% decrease from the base year. The mid-term goal is to further decrease emissions to 39.96 million tons by 2030, a 35% reduction compared to the base year. After years of promoting energy conservation, emission reduction, and circular economy, emissions were reduced to 51.83 million tons by 2020, a 15.7% decrease from the base year. It has further dropped to 46.94 million tons in 2023, a 23.6% decrease from the base year. Moving forward, FPG will continue to keep pace with government policies and the international ESG development, while making plans to striding forward for achieving the long-term objective of carbon neutrality by 2050.

Trajectory of Formosa Plastic Group’s Short to Long Term Carbon Reduction Objectives

Note :
1. CO₂-e is used to convert amounts of other greenhouse gases to the equivalent amount of carbon dioxide with the same global warming potential.
2.The third-party audit for confirming the amount of greenhouse gas emissions was carried out by SGS (Société Générale de Surveillance) and BSI (British Standards Institution) .

CIRCULAR ECONOMY IMPLEMENTATION

Harmonizing Industry and Ecology for Sustainable Development

Chairman WenYuan Wong follows the spirit of the two founders - “with diligence and modesty, we strive for excellence”, the management team, in order to maintain a robust enterprise operation, must be persistent, and always seek innovation and breakthroughs. Since 1993, we have implemented the 5S principle with every effort; later on, the no leakage policy, energy conservation and emissions reduction, and circular economy have been progressively promoted. We are currently focused on the AI, AI+simulation and digital transformation.

1993
5S

- Uphold the spirit of “with diligence and modesty, we strive for excellence.”
- Exert every effort in the implementation of 5S management principle: Seiri, Seiton, Seiso, Seiketsu, Shitsuke.

1999
No leakage

- Implementation of the no leakage policy: No steam leakage, no water leakage, and no oil leakage to become friendlier to the environment and increase rainwater recycling. In the beginning, recovered rainwater was not clean enough and only suitable for plants watering.
- Using Mailiao Industrial Complex as an example, an average of 19,110 tons of rainwater was collected each day in 2024, which is equal to saving USD 8,511/day in water charges or the domestic water consumption of the complex's 13,000 employees over 2.5 weeks.

2006
Energy conservation and emission reduction

- An enterprise-wide "Energy Conservation, Carbon Reduction, and Pollution Prevention Task Force" was established and became the foundation for subsequent efforts to achieve a circular economy.
- Using Mailiao Industrial Complex as an example, a total of 3,002 water saving and 12,011 energy conservation projects were completed as of 2024.

2016
Circular economy

- Further on, four aspects of circulation, namely raw materials, water resources, energy, and waste has been taken into consideration .
- Executing inter-factories, intercompany energy and resource integration to achieve better energy conservation, emission reduction, and efficiency of energy utilization.
- Taking water resource circulation in Mailiao Industrial Complex as an example, impurities have been removed from the recycled rainwater, thus can be further used in processes; for now, every drop of water is used 12.9 times.
- At the end of 2024, we have invested a total of USD 1.38 billion, generating approximately USD 1.23 billion in benefits each year.

2017
AI

- We donated USD 1 million to Academia Sinica at the end of 2017 to aid them in the establishment of an AI academy, and personnel were assigned to undergo training. By the end of 2023, a total of 592 employees across the entire company had participated in the training.
- Since the beginning of 2024, AI classes have become routine in Technical Training Center; Currently we have 42 personnel completed the training.
- Began optimizing industrial safety management and production processes to maximize productivity and energy efficiency.
- By the end of 2024, the Group has initiated 2,502 AI projects and expects to invest USD 112.9 million for an estimated annual benefit of USD 284.6 million. So far, 1,660 projects have been completed with USD 83.9 million invested for an annual benefit of USD 221.2 million.
- The future goal is for annual benefits to reach USD 700-1,000 million.

2021 February
AI+ Simulation

- AI involves using Big Data to optimize the manufacturing process.
- Simulation refers to optimizing the manufacturing process by applying chemical engineering theories or its experimental data.
- It is necessary to consider the risks in the manufacturing process, so AI and simulation are integrated.
- For example, petrochemical companies optimize the procedure for propylene recycling via an AI-enabled operating system, and Formosa Chemicals & Fibre Corporation (FCFC) has established a simulation factory for aromatic hydrocarbons to enhance production efficiency.

Now
Digital transformation

- Utilize all digital technologies (AI, big data, cloud, IoT, 5G) to optimize processes and improve business performance.
- On September 24, 2020, the Chairman: We'll make every effort to promote digital transformation.

The concept of circular economy is to take the aspects of raw materials, water resources, energy, and waste into mutual consideration, and engage tremendous human and material resource to execute inter-factories and intercompany resource integration for energy conservation and emissions reduction (the schematic diagram shows the example of FPG's 1-Butanol plant).

Mailiao Industrial Complex

Implementation of a Circular Economy in Mailiao Industrial Complex

We established the enterprise-wide "Energy Conservation, Carbon Reduction, and Pollution Prevention Task force" in 2006 to assist factories making improvements. Later on, the idea was combined with the circular economy philosophy in 2016, and further expanded to inter-factories and intercompany integration. As of the end of 2024, we have invested a total of USD1.38billion, which have generated approximately USD 1.23 billion benefits each year.

Among all effort in pursuing the circular economy, process water usage reduction, wastewater and rainwater recycling have reduced water consumption, and the water recycling rate reached 91.5%. A total of 3,002 water conservation projects were completed, saving approximately 113.2 million tons/year of water, which is equal to the annual water consumption of approximately 1.24 million people and is enough water to fill 45,284 Olympic-size swimming pools. Compared to the water consumption in 2007, while average daily production yield of the Sixth Naphtha Cracker Project increased by 4% in 2024, in the

meantime, water consumption decreased by 22% and unit product water consumption decreased by 25%.

Furthermore, we are vigorously promoting the projects to increase energy efficiency, waste heat recycling, and energy usage integration between factories. As of the end of 2024, we have completed 12,011 energy conservation projects which are able to reduce steam consumption by 3,550.2 tons/hour and energy consumption by 370.7 thousand kWh/hour; the energy saved is equal to reducing 14.25 million tons of CO₂ emission per year, the carbon absorption capacity of approximately 2.04 billion trees a year, or 36,632 times the annual carbon absorption capacity of Da'an Forest Park. Taking the examples of steam and energy saving results, while compared to those of 2007, the daily production rate in 2024 has increased by 4%, steam and energy consumption have decreased by 17% and 15%, respectively; unit product steam and energy consumption have decreased by 20% and 18%, respectively.

It is our belief that industrial development and environmental protection are equally important and can coexist. Therefore, Mailiao Industrial Complex invested USD 4.2 billion in advanced pollution prevention technology. In the case of air pollution prevention, coal used by the coal-fired power plant is transported and stored in a closed system to prevent fugitive coal dust. The discharged flue gas is treated by denitrification, desulfurization, and static dust precipitators to remove pollutants, and emitted pollutant concentration levels are far lower than the national standards. Furthermore, state-of-the-art technology has been applied to the power plants' air pollution control device. Hence, the emission level rival with those of natural gas power generators.

Pollutants	Emission Standards				EIA Promise	Stricter standards adopted by Yunlin Country	Mailiao Industrial Complex coal-fired power generators (2024)	Natural gas power generators in Taiwan
	EU	USA	Japan	Taiwan				
SOx(ppm)	70	63	63	60	25	25	11.19	0.33~0.55
NOx(ppm)	98	68	200	70	46	46	31.58	12.5~37.5
TSP(mg/Nm³)	20	20	100	20	23	15	3.0	2.5~10.0

OVERSEAS PRODUCTION BUSINESS

FPG Global Production Bases

US Region

In 1978, Formosa Plastics Group landed in the United States as a location for the overseas investment, primarily due to its abundant natural resources, mature political and economic systems, well-established legal framework, excellent infrastructure, and high-quality workforce.

Through years of effort, we have established several entities including Formosa Plastics Corporation, U.S.A., Nan Ya Plastics Corporation, U.S.A., and Nan Ya Plastics Corporation, America. We also own multiple large-scale petrochemical cackers and downstream processing plants in the country.

Formosa Plastics Corporation, U.S.A., headquartered in Livingston, New Jersey, operates production facilities in Point Comfort, Texas, and Baton Rouge, Louisiana. Initially focused on polyvinyl chloride (PVC) powder and related plants, the company made a significant investment in 1990, allocating \$1.9 billion to construct upstream ethylene production and eight related petrochemical plants at the Texas site. These facilities commenced operations successfully in 1994, marking a major achievement. Additionally, the second ethylene cracking unit and expansions for polyethylene and polypropylene were completed in early 2002. With these developments, Formosa Plastics Corporation, U.S.A., emerged as one of the leading producers of PVC powder, polyethylene, polypropylene, and chlor-alkali in the United States. By establishing an integrated

Formosa Plastics Corporation, USA – Texas Plant

petrochemical operation, the company ensured a stable supply of raw materials, reduced costs, and laid a solid foundation for its development in the United States.

NPCUSA was founded in 1979. It produces PVC and A-PET rigid film in Wharton, Texas and SMC Door in Houston, Texas.

NPCA was founded in 1989 and produces PVC flexible film, ethylene glycol (EG), and polyester fiber in Batchelor, Louisiana, Point Comfort, Texas, and Lake City, South Carolina respectively.

To leverage the abundant shale gas resources and mature production technologies in the United States, Formosa Plastics Corporation, U.S.A., completed the expansions of the High Density Polyethylene Plant 3 (HDPE-3), Olefins Plant 3 (OL-3), and Lolita Packaging Plant in 2019. Furthermore, the Low Density Polyethylene Plant (LDPE) and Ethylene Glycol Plant 2 (EG-2) successfully commenced operations in the fourth quarter of 2020. With the completion of debottleneck expansions at the Texas VCM plant in the fourth quarter of 2023 and the Louisiana PVC plant in the third quarter of 2024, the supply of PVC raw materials has become more robust. Formosa Plastics Corporation, U.S.A., has enhanced its overall portfolio of polyolefin and polyester products in the United States.

China

China gradually opened its market to the world after the 1980s and attracted investments from companies around the world with its low labor costs and massive domestic market. FPG saw this development trend and began investing in China in 1994, starting with secondary processing for Nan Ya Plastics Corporation. We established the petrochemical materials zone in Ningbo City, Zhejiang Province in 2001 to meet the massive demand of China's processing industry, and established self-sufficient production in the upstream and midstream industries.

We currently have over ten production bases in China, located in Guangzhou, Xiamen, Nantong, Kunshan, Ningbo, Zhongshan and Changshu and have invested in petrochemical materials, primary and secondary processing of plastics, electronic materials, heavy machinery and textiles.

Huizhou Plant in China

Vietnam

In response to the high cost of textile products in Taiwan, FPG established textiles, fibers, and secondary plastics processing plants in Vietnam in 2001, and relocated a portion of its production units to Vietnam. We found new prospects for the industry and also adjusted our business structure for our long-term development.

Current investments in Vietnam include textiles, power generation, polyester fiber, BOPP, nylon chips, and nylon textile yarn. All of these investments are already in the mass production phase and Vietnam will become our main textiles and fiber production center in Asia.

Optimistic about Vietnam's steel market, geographic location, government policy, and ASEAN tariffs, FPG, China Steel Corporation, and Japan's JFE Steel Corporation set up the joint venture Formosa Ha Tinh Steel Corporation, and built an integrated steel mill in Vung-Ang Economic Zone, Ha Tinh Province, Vietnam and a deep water harbor in Son Duong District. It is currently the largest foreign direct investment project in Vietnam, and also the first integrated steel mill in Vietnam.

The total invested amount for phase one construction was approximately USD12.8 billion. The two blast furnaces annual production capacity of molten iron will reach 7 million tons. The main products of the plant include slabs, blooms, billets, hot-rolled steel coils, bars and rods. We constructed a deep-water harbor in Son Duong District and 13 berths are all currently in use. The harbor meets the requirements for raw material imports and steel exports of Formosa Ha Tinh Steel Corporation.

The completion of phase one construction made Formosa Ha Tinh Steel Corporation the largest integrated steel mill in ASEAN. With Ha Tinh Province at the center, it has enabled Vietnam's steel industrial chain to flourish along with midstream and downstream industries. It will develop Ha Tinh Province into a place of strategic importance to the international steel industry. Exports to ASEAN countries and Europe market have brought considerable economic benefits for Vietnam.

Ecological Park of Formosa Ha Tinh Steel Corporation

HEALTHCARE AND EDUCATION BUSINESS

Taken from the community, giving back to society

Aerial View of Linkou Chang Gung Memorial Hospital

Chang Gung Memorial Hospital

Aiming to “take from the society and use it for the society”, FPG has established several medical and educational nonprofit organizations. Chang Gung Memorial Hospital was funded in 1976 when Taiwan was in great shortage of medical facilities. As there were only 19 medical beds for every per 10,000 persons, it was far lesser than 40 beds per 10,000 people standard in modernized nations. To address the problem, we built big hospitals in Taipei, Linkou, Keelung, Kaohsiung, Taoyuan, Chiayi and Yunlin. Chang Gung Medical Foundation also accepts government's commission to build and operate Kaohsiung Municipal Feng-Shan Hospital and New Taipei Municipal TuCheng Hospital. At present, Chang Gung treats 35,200 outpatients daily and has 11,268 beds available for inpatients. It is one of the largest, best equipped, and best-performed general hospitals in the Far East.

To provide children with more professional medical care, Chang Gung Memorial Hospital established a major children medical center in Linkou and Kaohsiung in 1993 and 1994 respectively, with a total capacity of 800 inpatient beds. In order to attain the best efficiency for the use of medical resources, we founded Nursing Home in early 2001, and established Taoyuan Branch for both acute and chronic medical care in December of 2003, to target chronic medical and long-

2024 Chang Gung Medical week

Chang Gung-Tsing Hua Collaboration Committee

term nursing services and to provide people with complete medical treatments. While the population of people over 65 years old has now exceeded 17% of total population, our Health and Culture Village has been completed and opened for service since January 2005 to provide 1,263 rooms for ideal community for older people to spend the rest of their lives.

Furthermore, in order to promote Traditional Medicine by combining it with the modern and scientific-techniques and approaches of Western Medicine, we have established the first medical-center-grade Chinese medicine department in Taiwan.

In order to optimize our medical services, we also established a cancer center to develop our critical-disease-based specialist medical service. We invest billions of dollars to set up the Asian first and largest Proton and Radiation

Therapy Center at Linkou Y.C.WANG Center for Advanced Medicine, had started service since Nov 2015. We have also set up YUNG-CHING Premier Cancer Therapy Center and provided proton radiation therapy at Kaohsiung branch since Oct 2018.

In December 2020, Intuitive Surgical Inc.'s U.S. headquarters commissioned Chang Gung Memorial Hospital to establish Taiwan's first and Asia's third "Robotic Surgery Training Center." In November 2023, they signed an agreement to establish Asia's only "Permanent Da Vinci Cadaveric Training Center", serving as a training and certification site for domestic and international surgeons. To enhance the surgical skills of surgeons, CGMH has established the international-level "Chang Gung Memorial Hospital Surgical Training Academy and Research Center" (CGMH-STARC), which was officially opened on March 14, 2023. It stands as the largest surgical training facility in Taiwan.

The 1st Senior Health Industry Expo 2024

Chang Gung Memorial Hospital has paid great attention to both clinical and basic medical research since its founding. Based on the established systems in research resource management, we continuously devote our resources to recruiting potential scholars and physicians to set up institutes, research centers, core laboratories and research platforms across all areas. In addition, there are research platforms include Laboratory Animal Center, Clinical Trial Center, Bacteria Bank and Virus Core Laboratory. These facilities provide high quality resources and are user-friendly, resulting in excellent achievements in the field of medical research.

Following the principles of founder Wang Yung-Ching, Chang Gung Medical Foundation is dedicated to utilizing information technology to integrate operations, manpower, and equipment, assisting in the functioning of healthcare services and elevating their quality.

The foundation consistently undergoes certification by the Healthcare Information and Management Systems Society (HIMSS). In 2019, it became the first hospital in Taiwan to achieve Level 7 certification, the highest level, in the HIMSS Electronic Medical Record Adoption Model (EMRAM). In 2022, it participated in the Digital Health Indicator (DHI) evaluation, ranking as the world's second and Taiwan's top smart hospital.

In 2024, Chang Gung Memorial Hospital achieved certifications for INFRAM (Infrastructure Adoption Model) stage 7, DIAM (Digital Imaging Adoption Model) stage 6, and AMAM (Analytics Maturity Assessment Model) stage 6. CGMH becoming the first hospital in Taiwan to achieve DIAM stage 6 certification.

A special fund was set up to subsidize low-income and handicapped patients with medical expenses and taken an active part in social welfare.

In 2024, CGMH provided relief to over 2.99 million patients, CGMH have taken an active part in Social welfare such as Charity project of sport medicine, The protection of children and youths program, Children's health care, Health care system of communities in Yunlin County, Telemedicine service, Medical volunteer programs by employees, etc. An outlay over US\$ 21.97 million from our social service fund.

Chang Gung University

Chang Gung University was established in April 1987 and was originally named Chang Gung Medical College. It was later renamed Chang Gung College of Medicine and Technology and was upgraded to Chang Gung University in August 1997. To cultivate talents needed by the nation, the university has continuously established new departments and academic programs. Currently, it comprises four colleges: Medicine, Engineering, Management, and Intelligent Computing, offering a total of 22 departments, 25 graduate institutes, 1 bachelor's degree program, 7 master's degree programs, and 1 doctoral degree program. The university currently has 611 full-time faculty members, 638 adjunct faculty members, and 7,241 students.

In terms of education, Chang Gung University adopts a student-centered approach to designing innovative and distinctive teaching methods. It has expanded courses in programming languages and AI applications, promoted small-class English instruction, and increased the availability of interdisciplinary programs to enhance students' cross-disciplinary skills, technological and digital competencies, and global mobility. The university also emphasizes cultivating students' humanistic care and literacy, implementing the philosophy of holistic education, and shaping students into high-level professionals who embody both knowledge and virtue, in line with the school motto, "Diligence, Perseverance, Frugality, and Trustworthiness."

In academic research, Chang Gung University fosters excellence by providing a comprehensive research ecosystem and ample resources, supporting faculty and researchers in pursuing outstanding research while ensuring the cultivation of scientific talent and sustainable development. In terms of academic performance, according to the 2024 list of the world's top 2% scientists published by a team of experts from Stanford University, USA, Chang Gung University ranks 6th nationwide and 1st among private comprehensive universities in Taiwan. Additionally, in the 2024 CWTS Leiden Ranking released by Leiden University, Netherlands, the university is ranked 237th globally and 3rd in Taiwan. Notably, in the field of Biomedical and Health Sciences, the university ranks 79th worldwide and 1st in Taiwan, solidifying its status as a leading research university with significant scientific impact.

Chang Gung Electrical Engineering 5G Base Station Teaching System

Ming Chi University of Technology

Ming Chi University of Technology was founded in 1963 as Ming Chi Institute of Technology, upgraded in 1999, and then approved for further transformation into a university in 2004. Currently, the University consists of Colleges of Engineering, Environment & Resources, and Management & Design, offering 3 Ph.D. programs, 12 M.A. programs and 13 departments. The University currently hosts approximately 4,400 students and 206 faculty members. All the Departments and Graduate Institutes have passed the certifications of IEET (Institute of Engineering Education Taiwan) or ACCSB (Accreditation of Chinese Collegiate School of Business). Through the years, Ming Chi has been receiving excellent Ministry of Education evaluation results. In addition, Ming Chi has ranked number four among all the technological universities nationwide and number one among private technological universities for the average amount of funding per MOST research project director in 2024. Also, according to the data collected from Web of Science, Ming Chi ranked number one in 2024 among all the technological universities in producing SCI/ SSCI papers per author by assistant professors and above.

Since its establishment, Ming Chi has been a boarding school and implemented “co-op practical training programs. Students keep a regular daily routine and become physically stronger through living on campus. The one-year co-op practical training by combining theories and practices achieves the goal of holistic education, and cultivate talents with the attitude of diligence, perseverance, frugality, trustworthiness, and the abilities in integrating both theories and practices as well as life-long learning.

In these years, industry-academia research and development has become the school focus. Ming Chi ranked number one nationwide in 2024 for securing the highest per capita amount of industry-academia cooperation projects.

Ming Chi has attempted to integrate interdisciplinary resources and built ten featured research centers, including Research Center for Intelligent Medical Devices, Artificial Intelligence and Data Science Research Center, Environmental Sustainability and Human Health Research Center and Intelligent Vehicle R&D Center. Ming Chi has evolved into a technology university specializing in industry-academia research and development. It is expected that, by closely cooperating with industries, Ming Chi will achieve a “win-win situation” of reaching educational goals and improving industrial technological force.

Intelligent Vehicle R&D Center

Chang Gung University of Science and Technology

Group founders the Wang brothers established the Chang Gung Institute of Nursing in 1988 to increase the number and quality of nursing personnel. The institute initially offered two-year and five-year clinical nursing courses to provide education and training for clinical nursing personnel. Since 1995, the institute has offered free tuition to five-year nursing students of aboriginal background to provide them with education and employment opportunities. To enhance the level of vocational education, the institute was restructured in 2002 into the Chang Gung Institute of Technology (CGIT). In August 2011, CGIT was again renamed, to Chang Gung University of Science and Technology (CGUST). Presently, the university has two colleges: Nursing and Human Ecology, under which there are four graduate schools, six departments. The University currently has approximately 316 full-time teachers, and has more than 5,908 students enrolled.

To enhance ties with the industry and promote academic research, CGUST strongly encourages and supports teachers participating in applied research projects and cooperation with industry. CGUST established Taiwan's first domestic nursing Clinical Competency Center, Research Center for Food and Cosmetic Safety, Center for Drug Research and Development, Chronic Diseases and Health Promotion Research Center, and Aging and Long-Term Care Research Center. All departments and programs received the highest five-year accreditation from the Taiwan Assessment and Evaluation Association (TWAEA) under the "Higher Education Quality Assurance Program," earning high praise for teaching quality. The registration rate and graduate employment rate were top among all universities.

Our university upholds the motto “diligence, perseverance, frugality, and trustworthiness” and adheres to the philosophy of “putting people first and seeking truth from facts.” With “health care” as our core focus, we position ourselves as a “university that values teaching and research equally while pursuing sustainable development in health care.” Our mission is realized through “talent cultivation,” “industry-academia R&D,” “sustainable development,” and “service and guidance.” We aim to nurture practical health care professionals, establish distinctive features in health care education and research, and actively fulfill our social responsibilities.
